

amvExplorer
amvCalendar

ABOUT ME

André Minhorst, born in 1971

Degree in Mechanical Engineering

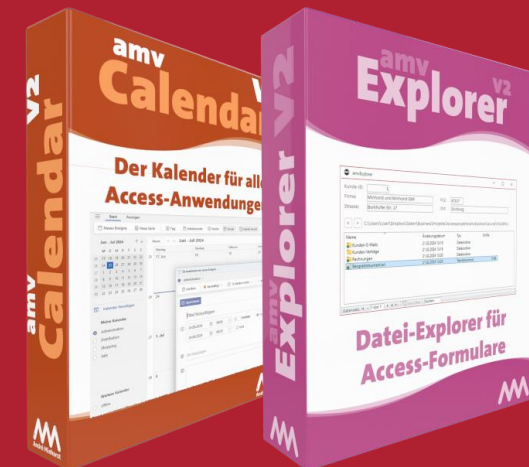

Writer, Programmer and Publisher since 1998

Written more then 18.000 pages for magazines like this...

Written some books like ...

And selling some cool Access tools.

In this presentation I will show you the newest tools amvCalendar and amvExplorer.

amvCalendar

Why amvCalendar?

- Most applications work with appointments, for example Birthdays, Orders, Deliveries, Meetings, ...
- Why not show and manage your appointments right inside your Access application where you also manage the other stuff?
- We will show you how easy this is with amvCalendar.

amvCalendar

amvCalendar is ...

- **Compatible with SQL Server**
- **All data is stored in tables so you can access it from other objects.**
- **Integration is very easy: You just add all objects of the demo and open the form FRM_CAL_MAIN.**
- **You get the full source code so you can change everything.**

You find amvCalendar here: <https://www.andreminhorst.de/amvcalendar>

- **Single license: 99 EUR**
- **Ultimate license: 399 EUR - Use Code AUG15 for 15% discount – valid until July 31st, 2024**

amvExplorer

Why amvExplorer?

- We often have files that are related to the data we store in our databases.
- One typical example:
 - Customers: invoices, orders, emails, ...
 - But this also applies to projects, products and more.

AMVEXPLORER

Where do we store the files associated to a customer?

- **Usually in a subfolder named after the customer, product or project name or number. The files may be referenced in a field in a table.**
- **Alternatively in an OLE field or an Attachment field, but: Space in databases is limited.**

When using a folder:

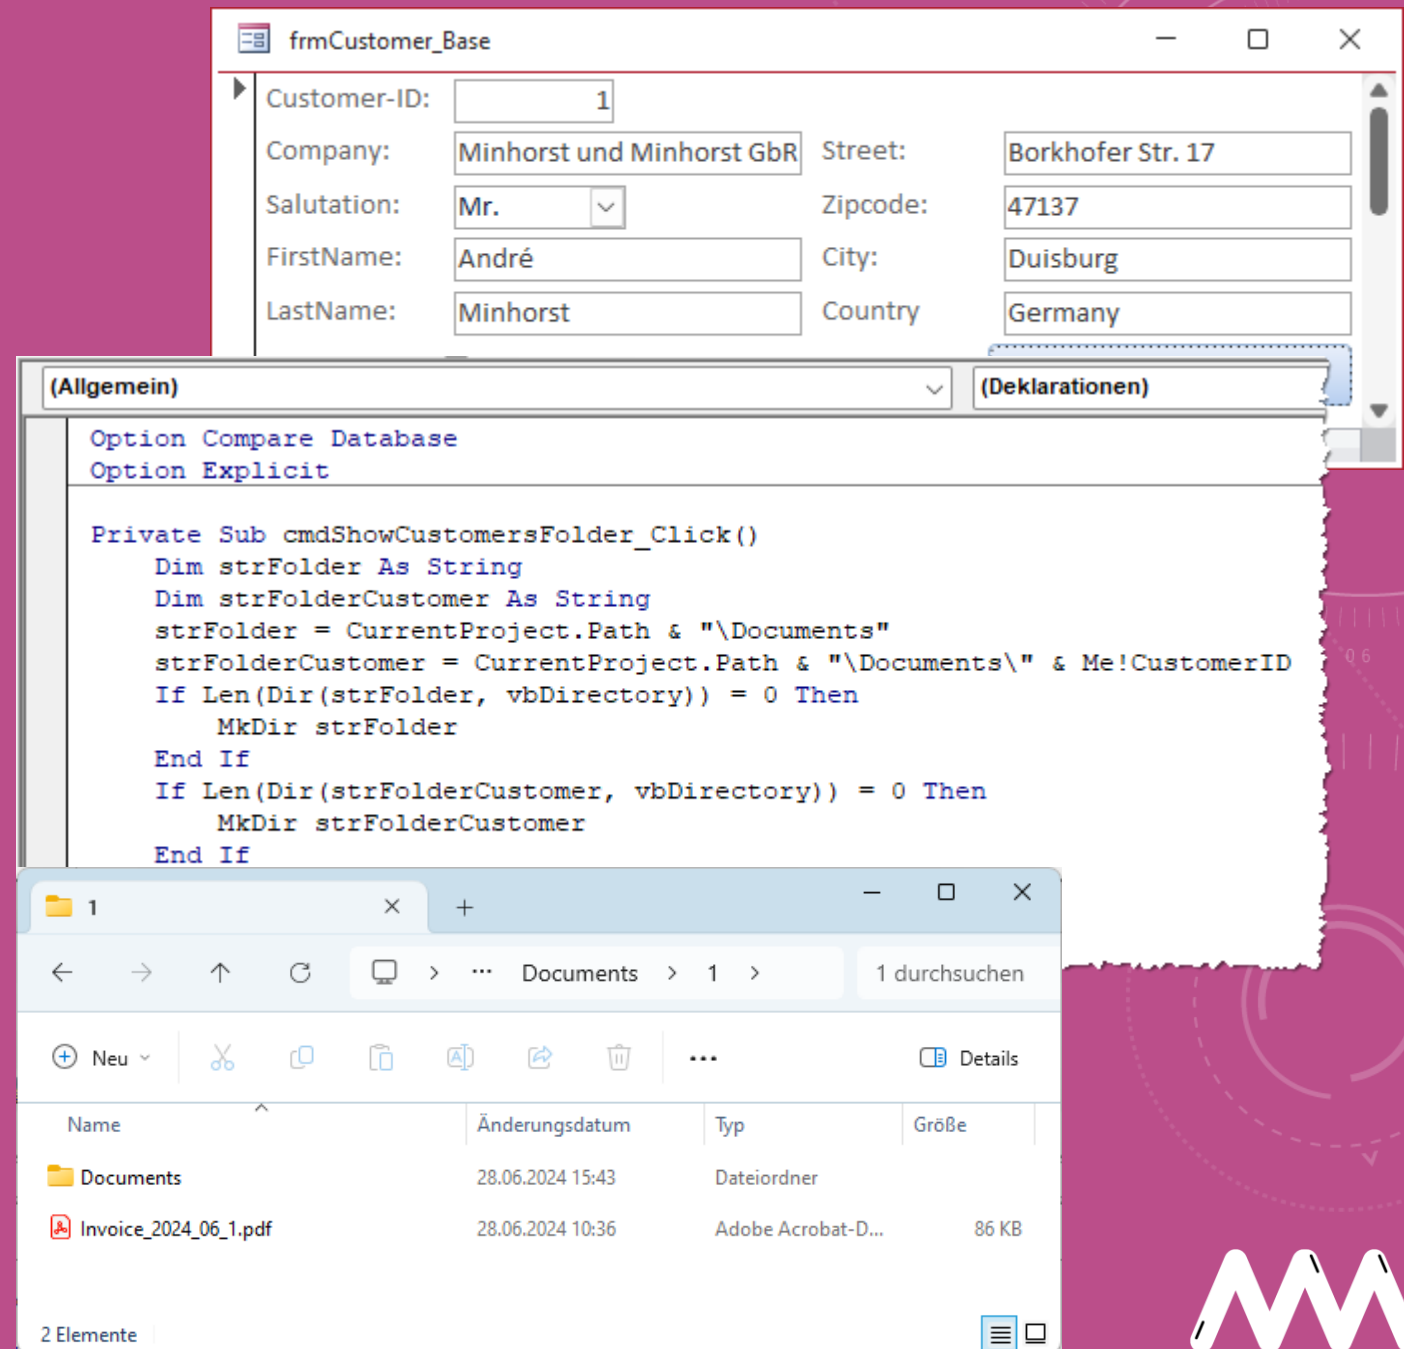

- **How do we display these directories to see the data they contain when we are working with our database?**
 - **Normally we only see the path in a textbox,**
 - **when stored in an attachment field we don't see the file at all**
- **Inexperienced developers just open the Windows Explorer and navigate to the appropriate folder to look up the files.**

amvExplorer

- More experienced developers could use commands like »Shell« to open Windows Explorer and show the desired folder.
- An example to open a specific folder with VBA is the following command:
`Shell "Explorer.exe c:\Documents\Customers\123", vbNormalFocus`
- We can use this command for a solution that is much better than to open Windows Explorer manually all the time:

amvExplorer

- We could use a button to open a specific folder for the current customer.
- Then we would use code like this in order to do this:
- This opens the appropriate folder.

amvExplorer

- But wouldn't it be much easier if we could integrate Windows Explorer directly into an Access form?
- What if we could show the corresponding folder for the customer or product right in the form?
- This is possible when you use amvExplorer.
- Let's have a look how this works.

The screenshot shows a Microsoft Access form titled "frmCustomerWithWatcher". The form contains several text boxes for customer information:

- Customer-ID: 1
- Company: Minhorst und Minhorst GbR
- Street: Borkhofer Str. 17
- Salutation: Mr. (dropdown menu)
- Zipcode: 47137
- FirstName: André
- City: Duisburg
- LastName: Minhorst
- Country: Germany

Below the text boxes are two navigation buttons: "<" and ">".

Below the navigation buttons is a table displaying a file explorer view:

Name	Änderungsdatum	Typ	Größe
Documents	28.06.2024 15:43	Dateiordner	
Invoice_2024_06_1.pdf	28.06.2024 10:36	Adobe Acrobat-D...	86 KB

At the bottom of the form is a status bar with the following elements:

- Record: 1 of 2
- Navigation buttons: back, forward, first, last, search, etc.
- Filter: No Filter
- Search: Search

amvExplorer

- What do we need to do to implement amvExplorer in our own application?
- We need some objects.
- We import them from the demo database ...
- ... by selecting all tables and modules ...
- ... and adding them to the current database.

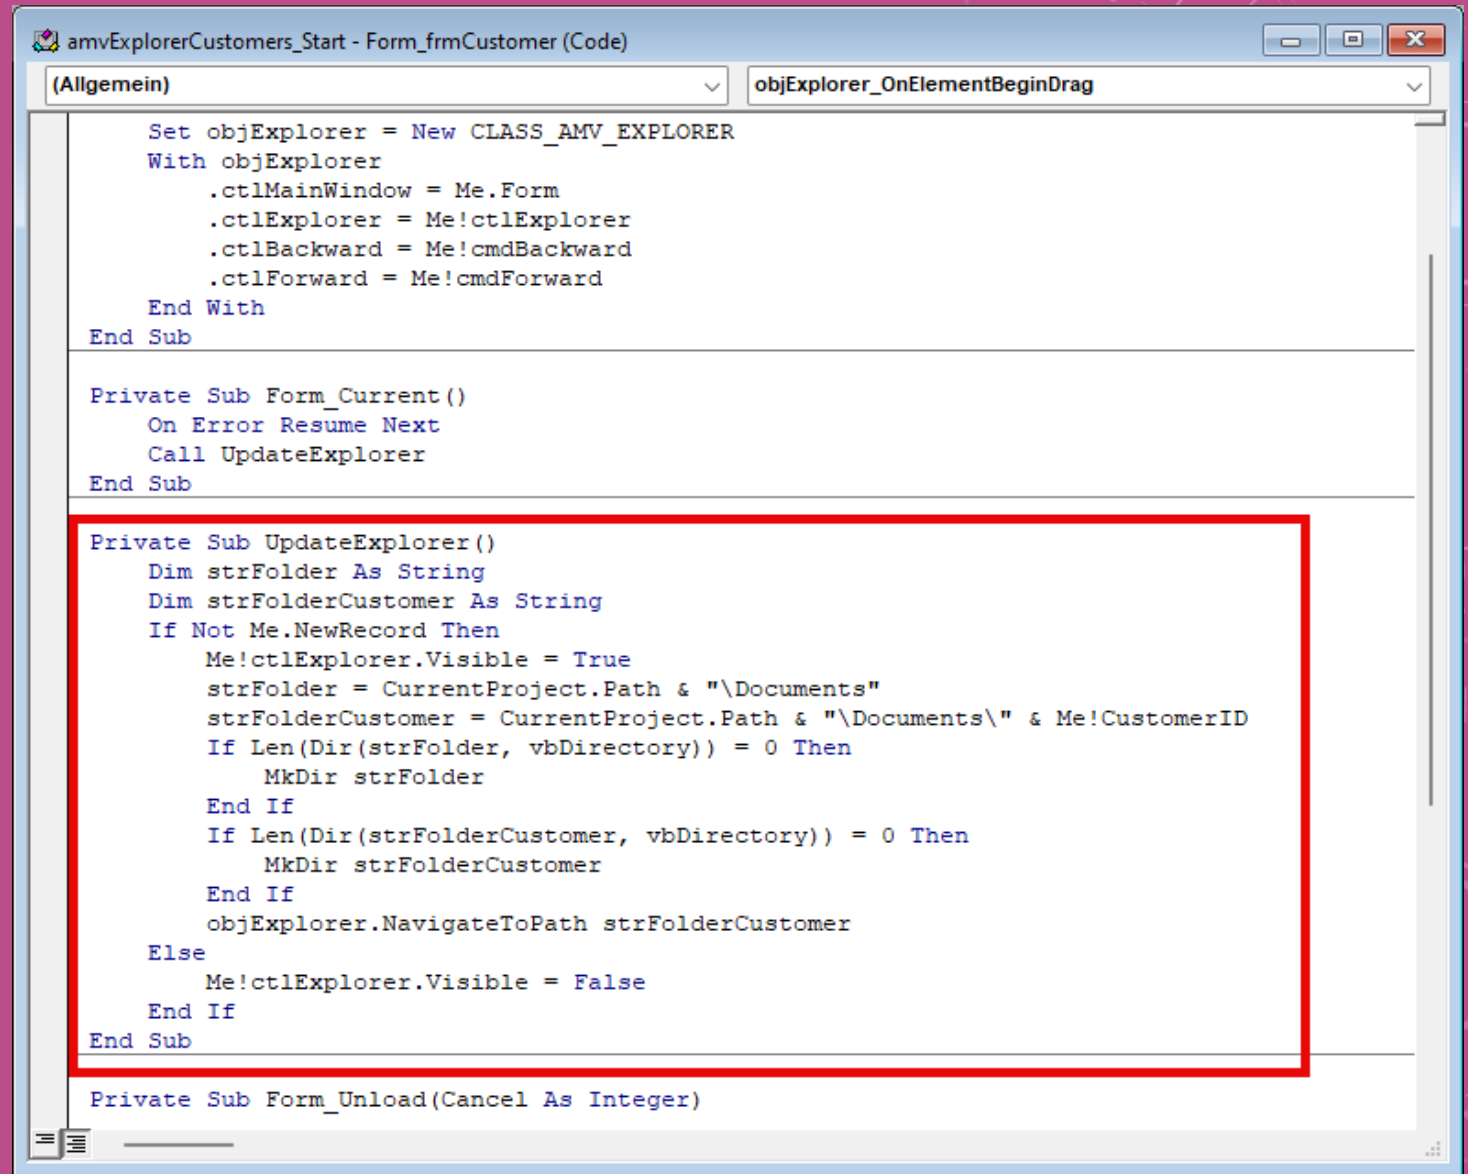

amvExplorer

- What do we need to implement amvExplorer in our own form?
- First we need a web browser control.
- We name it ctlExplorer.

amvExplorer

- Then we add some code.
- Starting with the event Form_Open.
- Before we edit it, we add a variable.
- Then we add the code for Form_Open.
- Moreover we need a Form_Current event.
- ... and the sub it calls.
- We also need an unload event.
- And finally some more event procedures like these that allow specific actions.

```
amvExplorerCustomers_Start - Form_frmCustomer (Code)
(Allgemein) objExplorer_OnElementBeginDrag

Set objExplorer = New CLASS_AMV_EXPLORER
With objExplorer
    .ctlMainWindow = Me.Form
    .ctlExplorer = Me!ctlExplorer
    .ctlBackward = Me!cmdBackward
    .ctlForward = Me!cmdForward
End With
End Sub

Private Sub Form_Current()
    On Error Resume Next
    Call UpdateExplorer
End Sub

Private Sub UpdateExplorer()
    Dim strFolder As String
    Dim strFolderCustomer As String
    If Not Me.NewRecord Then
        Me!ctlExplorer.Visible = True
        strFolder = CurrentProject.Path & "\\Documents"
        strFolderCustomer = CurrentProject.Path & "\\Documents\\" & Me!CustomerID
        If Len(Dir(strFolder, vbDirectory)) = 0 Then
            MkDir strFolder
        End If
        If Len(Dir(strFolderCustomer, vbDirectory)) = 0 Then
            MkDir strFolderCustomer
        End If
        objExplorer.NavigateToPath strFolderCustomer
    Else
        Me!ctlExplorer.Visible = False
    End If
End Sub

Private Sub Form_Unload(Cancel As Integer)
```

amvExplorer

- Moreover we want to use the Forward and Backward buttons. We just have to set the properties `ctlBackward` and `ctlForward` to the desired buttons.
- And we need some code to hide the control when we add a new customer, that doesn't have an ID yet and that makes it visible when the record is created.
- But we won't look into this in detail.

```
Private Sub Form_Open(Cancel As Integer)
    Set objExplorer = New CLASS_AMV_EXPLORER
    With objExplorer
        .ctlMainWindow = Me.Form
        .ctlExplorer = Me!ctlExplorer
        .ctlBackward = Me!cmdBackward
        .ctlForward = Me!cmdForward
        .objWatchNotifyEventFilter = FILE_NOTIFY_CHANGE.F
        Or FILE_NOTIFY_CHANGE.FILE
        Or FILE_NOTIFY_CHANGE.FILE
        Or FILE_NOTIFY_CHANGE.FILE
    End With
    .RegisterWatcher
End Sub
```

amvExplorer

Using the watcher

- **What is the watcher? The Watcher is a timer that controls what happens in a specific folder.**
- **We can implement different events fired by the watcher.**
- **So we can basically react to the following events:**
 - Adding files and folders
 - Removing files and folders
 - Renaming files and folders
 - And changing the content of a file

amvExplorer

```
Private Sub Form_Open(Cancel As Integer)
    Set objExplorer = New CLASS_AMV_EXPLORER
    With objExplorer
        .ctlMainWindow = Me.Form
        .ctlExplorer = Me!ctlExplorer
        .ctlBackward = Me!cmdBackward
        .ctlForward = Me!cmdForward
        .prpWatchNotifyEventFilter = FILE_NOTIFY_CHANGE.FILE_NOTIFY_CHANGE_DIR_NAME _
                                     Or FILE_NOTIFY_CHANGE.FILE_NOTIFY_CHANGE_FILE_NAME _
                                     Or FILE_NOTIFY_CHANGE.FILE_NOTIFY_CHANGE_CREATION _
                                     Or FILE_NOTIFY_CHANGE.FILE_NOTIFY_CHANGE_SIZE
        .RegisterWatcher
    End With
End Sub
```

What do we need for using the watcher?

- We need to call the RegisterWatcher method when opening the form.
- We need to terminate it when we close the form.
- And we need an event procedure for the event called WatchEvent.
- It comes with some parameters we can use to control what happens.

```
Private Sub Form_Unload(Cancel As Integer)
    If Not objExplorer Is Nothing Then
        objExplorer.RegisterTerminate
        Set objExplorer = Nothing
    End If
End Sub
```

```
Private Sub objExplorer_WatchEvent(ByVal Path As String, _
    ByVal ItemName As String, ByVal ItemType As String, _
    ByVal IsLink As Boolean, ByVal IsLinkFolder As Boolean, _
    ByVal LinkPath As String, ByVal LinkName As String, _
    ByVal EventAction As String)
    On Error Resume Next
    Select Case EventAction
        Case "MODIFIED"
            Debug.Print "MODIFIED", Path, ItemName, ItemType
        Case "ADDED"
            Debug.Print "ADDED", Path, ItemName, ItemType
        Case "REMOVED"
            Debug.Print "REMOVED", Path, ItemName, ItemType
        Case "RENAME NEW"
            Debug.Print "RENAME NEW", Path, ItemName, ItemType
        Case "RENAME OLD"
            Debug.Print "RENAME OLD", Path, ItemName, ItemType
    End Select
End Sub
```

amvExplorer

Some parameters of the watcher event:

- **Path:** Path of the file or folder
- **ItemName:** Name of the file or folder
- **ItemType:** Type, for example file or folder
- **EventAction:** One of the following values:
 - **MODIFIED:** Called when an element is changed
 - **ADDED:** Called when an element is added
 - **REMOVED:** Called when an element is removed
 - **RENAME OLD:** Called on renaming, can be used to retrieve the old name
 - **RENAME NEW:** Called on renaming, can be used to retrieve the new name

amvExplorer

How can we use the watcher practically?

- **We can make backups of added files**
- **We can extract content from Office documents and write it into the database**
- **We can write content from Outlook E-Mails in tables**
- **We can create PDF Documents from Word documents**
- **And many more! What are your ideas?
Feel free to write them in the chat!**

amvExplorer

amvExplorer has a few more interesting features.

All features are demonstrated in a form that comes with the demo.

- At the bottom we see the amvExplorer control.
- We see all shell events that we can track.
- We see the parameters of all events fired by the watcher.
- And we see some more properties we can use to disable specific actions – for example ...

amvExplorer 2.0

Project: Pro 300-400 Description:

Clear watcher event log Clear explorer event log

Browse... C:\Users\User\Dropbox\Daten\Business\Projekte\Accessprojekte\amvExplorer\Source\Beispiele_LearningSuite\FOLD

BY EVENT

- ☐ Enable navigate only to Main Folder
- ☒ Enable Item Drag
- ☒ Enable Item Execute
- ☒ Enable Item Menu Execute
- ☒ Enable Folderview Menu Execute
- ☒ Enable Item Rename in Folderview
- ☒ Enable Show Temp Files by Watch Events
- ☐ Enable Autorename by Extension (Add Item)

Extension: xlsx Key or ID: MyKey

Block events by extension: No Block

DATE	EVENT (WATCHER)	TYPE	NAME
30/06/2024	REMOVED	FILE	tet.txt

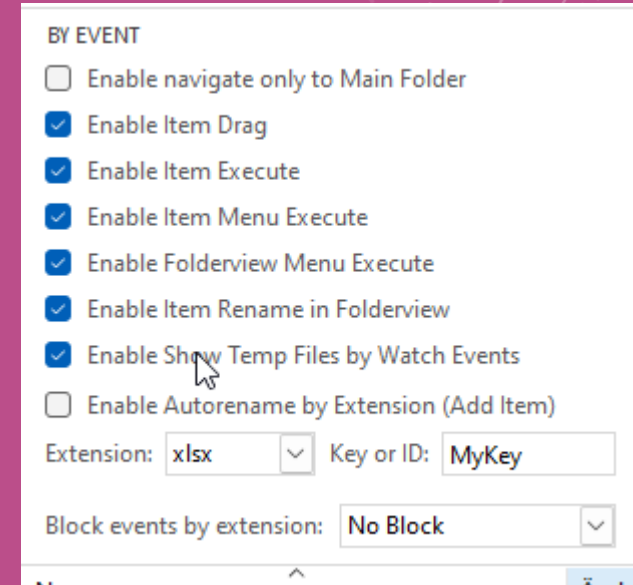

POS	EVENT (EXPLORER)
000017	Folder item count item(s): 1 item(s) selected: 0
000016	Folder view focused on normal folder ...1
000015	Folder item count item(s): 1 item(s) selected: 1
000014	Element focused on normal folder ...Neuer Ordner
000013	Folder item count item(s): 1 item(s) selected: 0
000012	Begin drag Watch

Name	Änderungsdatum	Typ	Größe
Neuer Ordner	25/06/2024 18:41	Dateiordner	

amvExplorer

Options to enable and disable functions

- We can make sure the user can only use the current folder.
- We can prevent dragging of the folders items into other folders.
- We can prevent executing files by double click.
- We can prevent executing files by using the context menu.
- We can prevent changing the view using the context menu
- We can prevent renaming items.

amvExplorer

amvExplorer ...

- ... can be used in any application.
- Integration is very easy: You just add all objects of the demo and add some controls and some code to your form.
- You get the full source code so you can change everything.
